

Product & Platform

Construction operations from office to field

Jobs | Field records | Safety | Time | Finance | Documents | Tools

Current product position, capability map and release outlook

Version 2.1 | Release 12.0.5 | iOS 12 (Build 17) | 26 August 2026

Executive summary

IWILLBUILD is an Australian construction-management software platform designed to connect office administration with day-to-day field work. The current product combines a responsive web application with a Capacitor-based iOS application, giving builders, contractors, supervisors and field teams a shared place for jobs, time, safety, records, documents and commercial workflows.

Current position Release 12.0.5 has been packaged as iOS Version 12, Build 17 and uploaded to App Store Connect for TestFlight processing. It is a beta release, not yet a public App Store launch.

Jobs

Files

Photos

Safety

Time

Finance

Fleet

Tools

The platform has moved beyond its earlier architecture-roadmap stage. It now presents a role-aware opening experience, direct Work & Field access, job-scoped navigation and standalone feature pages that resolve the selected job before loading the requested tool. This reduces duplicated navigation while retaining a connected job record.

What the platform brings together

- Job delivery: tasks, notes, delays, progress, attendance, photographs, drawings, files and forms.
- Workforce records: Monday-to-Sunday timesheets, start and finish times, unpaid breaks, leave categories, allowances and approval states.
- Safety and field assurance: safety documents, SWMS workflows, site prestarts, risk and permit records, incidents, risk register and SDS register.
- Commercial control: estimates, invoices, purchase orders, job ledger, cost records and reusable estimating tools.
- Specialist site tools: builders calculations, takeoff pad, RL register, electrical testing recorder and public-toilet finder.
- Platform controls: company tenancy, role-aware access, trusted devices, authenticator-app or SMS 2FA, account recovery and sign-in history.

Design intent One connected system, two working contexts: the desktop for setup and administration, and the mobile experience for fast, job-centred field work.

1. Product model and navigation

IWILLBUILD uses a shared platform foundation with focused operating areas rather than unrelated applications. Users enter through a role-aware home screen and see only the functions available to their role and company configuration.

Two paths to job work

1. Inside a job: open the job and select the required function from the job feature menu.
2. Direct from the app: select a Work & Field function, choose a job, then continue on a standalone page for that function.

Both paths resolve to the same canonical job-scoped capability. A single feature registry controls labels, icons, routes and grouping for Tasks, Notes, Delays, Progress, Attendance, Photos, Drawings, Files, Estimates, Purchase Orders, Invoices, Job Ledger, Forms and Safety.

Opening-page structure

Area	Primary purpose	Representative entry points
Work	Create and deliver work	Tools, Jobs, Job Cards, Scheduler, Log Cost
Field & Files	Capture and control evidence	Lens, Plan Manager, Files, Asset Manager
Fleet	Operate vehicles and equipment	Fleet records, inspections, driving sessions
Finance	Estimate, purchase, invoice and track	Estimates, Invoices, Ledger, Purchase Orders, calculators
Safety	Plan, record and evidence controls	Forms, Safety, Incidents, Risk, SDS, RL and electrical tests
Manage	People, access and administration	Timesheets, Team, Billing, Settings, Help and logs

Role-aware by default Owner and administrator functions are separated from ordinary worker access. Owner-only and desktop-only pages are guarded at routing level rather than merely hidden by navigation.

2. Capability map

The product suite is broad, but its structure is consistent: each area has a clear record, task and return path. The following map describes the current application surface evidenced in release 12.0.5.

Capability	What it manages	Typical field outcome
Jobs & Work	Jobs, tasks, notes, delays, progress and job cards	A worker opens the right job context quickly.
Attendance	Site sign-in, attendance records and close-out	Who was on site and when is recorded.
Lens & Photos	Capture, gallery, download, sharing and ZIP export	Site evidence stays connected and retrievable.
Plans & Files	Drawings, revisions, markup, folders and secure links	Current information is available in the field.
Forms & Documents	Templates, submissions, signatures, PDFs and libraries	Repeatable records can be completed and issued.
Safety	SWMS, prestarts, incidents, risks, permits, posters and SDS	Safety evidence follows an identifiable workflow.
Timesheets	Daily work times, breaks, leave, allowances and submission	Weekly hours are recorded against the correct user.
Finance	Estimates, invoices, payments, purchase orders and ledger	Commercial records connect to work without blocking it.
Fleet	Assets, inspections, usage and GPS-enabled driving sessions	Fleet activity can be managed independently of a job.
Field Tools	Calculators, takeoff, RL and electrical test recording	Common site calculations and evidence remain together.

3. Job and field operations

Job control

The job record remains the operational anchor for site delivery. A job can carry its identity, customer, address, team, status and schedule while exposing focused pages for the work performed against it.

- Tasks and checklists for assigned actions.
- Notes and observations for day-to-day context.
- Delay and condition records for programme impact.
- Progress and programme-of-works views.
- Job cards for discrete work and supporting photographs.

Evidence and information

Field teams can capture and retrieve the information needed to explain what happened on site.

- Job photographs with metadata, download, replacement, locking, sharing and ZIP export pathways.
- Drawings with upload, revision and markup support through job pages and Plan Manager.
- Files and document viewers for authenticated records.
- Forms that can be completed internally or through controlled token-based links.

Sharing boundary Public photo, plan, form and asset-report links use dedicated token routes. These links should be scoped, revocable and shared only with intended recipients.

Attendance and site entry

Attendance supports job-specific sign-in and close-out. A QR-oriented sign-in route can allow a guest or worker to enter the correct site workflow without exposing the rest of the portal.

- Job attendance pages for authenticated staff.
- Guest sign-in landing for the selected job.
- On-site counts and history surfaced to authorised users.

4. Time, leave and workforce records

The current timesheet workflow is designed around a Monday-to-Sunday week and an identified logged-in worker. This avoids exposing another worker's timesheet merely because multiple people use the same device: each person signs in to their own account before recording time.

Daily record

- Start and finish time, with support for overnight time calculations.
- Unpaid break minutes deducted from the calculated daily hours.
- Job allocation and optional work description.
- Work, paid leave, sick leave, public holiday or unpaid leave day type.
- Living-away-from-home (LAFHA/LAFA) and breakfast, lunch and dinner allowance indicators.
- Worked-day activation so non-standard days, particularly weekends, can remain inactive until required.

Weekly workflow

- Week-ending selection is constrained to the configured weekly cycle.
- Copy previous week and fill-week actions reduce repetitive entry.
- Draft and submit states support review before office processing.
- Company management views can review timesheets while user access remains scoped to identity and role.

Compliance-supporting record IWILLBUILD captures information commonly required for payroll and employment records, but configuration and use must be checked against the applicable award, enterprise agreement, payroll rules and laws. The software does not itself guarantee Fair Work or tax compliance.

Device sharing principle

A shared phone or tablet may be used, but not a shared identity. The employer or administrator links the person to the correct company and role; the worker then signs in before opening or submitting their timesheet. This is the clearest privacy and accountability boundary for multi-person device use.

5. Safety, assurance and specialist records

Safety system

IWILLBUILD provides structured workflows for planning, recording and issuing safety information.

- Safety document area with plans, uploaded records and library content.
- SWMS creation, duplication, import, submission, sign-off and PDF export pathways.
- Site prestarts with worker participation and finalisation.
- Risk and permit records, supervisor sign-off and signatures.
- Incident register and investigation workflow.
- Risk register, safety posters and SDS register with controlled document replacement and download.

Electrical testing recorder

The electrical testing tool records a test as an auditable work item rather than a loose photograph or note.

- Job-linked test records, equipment records and calculation support.
- Test-result and joint photographs attached to the record.
- Retest and sign-off workflow.
- Job-level PDF and CSV export for handover or review.

Professional judgement Test methods, acceptance criteria and sign-off authority remain the responsibility of competent personnel and the applicable standards. The recorder preserves evidence; it does not replace technical judgement.

RL register

The RL register records site levels and calculates rise or fall differences against a reference level.

- Job-linked entries and site descriptions.
- Positive or negative difference calculation.
- CSV export for further review or record keeping.

6. Finance, estimating and document output

Commercial lifecycle

Finance can be used as a connected commercial workspace while retaining job-specific entry points.

- Estimates with line items, defaults, CSV import/export, PDF export, email and conversion to invoice.
- Invoices with PDF generation, email, payment recording, unlocking and voiding controls.
- Purchase orders with job linkage, editing and PDF output.
- Job ledger and cost records for visibility of work-related transactions.

Estimating and site calculations

IWILLBUILD includes a dedicated estimating workspace and smaller site tools for fast calculation or quantity work.

- Cost guide, recipes and reusable estimating structures.
- Builders Calculator for areas, volumes, materials and cost estimates.
- Takeoff Pad for measuring and quantifying from plans.
- Public Toilet Finder that opens a nearby-toilets search in Google Maps without creating an IWILLBUILD location record.

Print and PDF standard

Business records are intended to print cleanly. Bright, full-colour treatment is appropriate for safety posters, while forms, estimates, invoices, purchase orders and registers should favour white backgrounds, restrained accents, legible tables and repeatable headers and footers.

Document boundary Generated PDFs are snapshots of the underlying record. Before issuing, the responsible user should verify names, dates, totals, signatures, revision status and attachments.

7. Mobile application and field-device capability

The mobile product uses Capacitor to package the shared application for iOS while retaining responsive browser access. The source includes native plugins for camera and media, filesystem access, geolocation, network state, push notifications, haptics, sharing, splash screen and status bar integration.

Mobile operating model

- The opening page prioritises job, field, safety, time and management actions that are usable on a phone.
- Desktop-only builder and owner functions are guarded and direct the user to an appropriate wider-screen workflow.
- Job-scoped features share routes and permissions with desktop, reducing platform drift.
- Camera, file and share functions use native capabilities where available and browser fallbacks where appropriate.
- Network-aware behaviour and upload state are important for field conditions, but users should confirm synchronisation before leaving a site or deleting local evidence.

Location use

Geolocation is used only by features that need it, such as fleet driving sessions or a user-initiated nearby search. Permission prompts, purpose limitation and data retention should be clear at the point of use.

Current distribution The iOS binary has been uploaded to App Store Connect and is being distributed through TestFlight for controlled external testing. The public App Store launch remains a separate release decision. No signed Android release or public APK is currently advertised.

TestFlight feedback focus

- Sign-up, email verification, sign-in and account recovery.
- Navigation, job selection and return paths.
- Timesheets, attendance, photos, documents and PDF output.
- Permission prompts, crashes, slow screens and confusing states.

8. Security, privacy and access control

IWILLBUILD stores information that may be sensitive: names, contact details, location records, photographs, timesheets, financial records, safety documents and electrical test evidence. Security therefore depends on both platform controls and careful customer administration.

Identity and sign-in

- Company-linked user profiles and role-aware route protection.
- Authenticator-app 2FA using time-based one-time passwords.
- SMS 2FA and SMS account recovery where the messaging service is configured.
- AES-256-GCM encryption for stored TOTP secrets, controlled by a stable environment secret.
- Pending-2FA session controls that limit access until the second factor succeeds.
- Trusted-device records, optional PIN sign-in and device revocation.
- Sign-in history and user logs for authorised administrative review.

Privacy boundaries

- A worker should see only the companies, jobs and functions granted to their identity.
- Public sharing uses purpose-specific token routes rather than opening authenticated portal pages.
- Location, camera and media permissions should be requested only when the user initiates the related function.
- Real customer, employee, financial or safety data should not be placed in demonstration or beta accounts.
- Administrators remain responsible for removing departed users, reviewing roles and revoking obsolete links or devices.

Shared device To complete a timesheet or private job record on another person's device, sign out the prior user and sign in as the correct worker. Selecting a name inside a shared session is not an adequate privacy control.

9. Architecture and integration posture

Release 12.0.5 remains one connected TypeScript/React application with shared routing, authentication, server APIs and company data. The architecture supports focused capability areas without forcing separate repositories or deployments before they are operationally useful.

Platform foundation

- React-based responsive interface with route-level lazy loading and protected pages.
- Server APIs for product records, exports, shares and authentication workflows.
- Company-aware database access and role checks for protected operations.
- Object storage and signed access patterns for media and file workflows.
- Capacitor iOS shell using the same product surface as the web application.

Integration boundaries

External services may include email, SMS, payments, object storage, maps, push notifications and accounting connectors. Credentials must remain in managed secrets, be resolved only by the server-side capability that needs them, and be rotated when ownership or deployment boundaries change.

Dazza AI

Dazza AI is routed as an owner/platform-owner capability. It should be treated as an assisted analysis layer with bounded, authorised data access—not as an autonomous operator. Human review remains necessary for decisions affecting safety, finance, access or customer records.

Architecture principle Modularity should improve repairability, testability and navigation. It should not duplicate identity, permissions or customer data merely to create separate-looking products.

10. Release position and known limitations

Release evidence

Item	Recorded position
Web/package	12.0.5
iOS	Version 12, Build 17
Repository	Main branch release commit 70660ef (26 August 2026)
Production build	Complete browser and SSR build passed during release preparation
Capacitor sync	Passed; iOS project synchronised with registered native plugins
App Store Connect	Signed package uploaded successfully for TestFlight processing
Public launch	Not yet a public App Store release

Known limitations

- The exported source retains a TypeScript diagnostics backlog even though the production bundler succeeds.
- Some unit and handler tests depend on Airo-managed modules or database configuration that is not reproduced in a standalone local harness.
- SMS functions depend on valid provider configuration, verified trial destinations where applicable and production messaging approval.
- App Store public distribution, final store metadata, privacy disclosures and review approval remain outstanding launch steps.
- Operational and legal configuration still requires customer-specific review; software fields alone do not establish compliance.

Release confidence The build has strong functional breadth and a successful packaging path, but the safest launch approach remains a controlled TestFlight cohort, monitored support, staged customer onboarding and evidence-driven fixes before broad public promotion.

11. Recommended launch sequence

1. Complete TestFlight processing and confirm installation, sign-up, sign-in and 2FA on more than one real device.
2. Run a short external beta with representative builder, supervisor, office and field-worker roles using demonstration data.
3. Triage crashes, permission failures, broken routes and data-isolation issues before cosmetic feedback.
4. Verify generated PDFs, emails, public-share links and revocation behaviour across the core workflows.
5. Confirm privacy policy, terms, support contact, App Store privacy answers, data-retention practice and incident response ownership.
6. Arrange suitable technology professional indemnity/errors and omissions, cyber/privacy and public/product liability cover before broad commercial use.
7. Submit the iOS build for public App Store review only when the beta exit criteria are met.

Suggested beta exit criteria

- No unresolved critical authentication, tenant-isolation, data-loss or crash defect.
- Core job, timesheet, attendance, photo, document and finance journeys complete on supported phones.
- SMS or authenticator 2FA can be enabled, challenged and disabled safely.
- Privacy-sensitive sharing and account controls have been tested with ordinary and administrator roles.
- Support and bug-report channels are monitored with clear ownership and response expectations.

Soft launch A TestFlight cohort is the practical soft launch for iOS. It allows real-world use without presenting the build as a finished public App Store product.

Commercial direction

IWILLBUILD's value will come from reliable daily use, retained customer records and lower administrative friction—not from feature count alone. Early commercial work should prioritise onboarding, support, data trust, role clarity and a small set of repeatable customer outcomes.

Appendix - Current feature inventory

This inventory reflects live routes and feature registries reviewed for release 12.0.5. Availability still depends on role, company configuration, device and deployment settings.

Area	Included functions
Work	Tools, Jobs, Job Cards, Log Cost, Scheduler
Job functions	Tasks, Notes, Delays, Progress, Attendance, Photos, Drawings, Files, Estimates, Purchase Orders, Invoices, Job Ledger, Forms, Safety
Field & files	Lens, Plan Manager, Files, Asset Manager
Finance	Estimating, Estimates, Invoices, Payments, Purchase Orders, Job Ledger, Builders Calculator, Takeoff Pad
Safety	Safety documents, SWMS, prestarts, risk and permits, incidents, risk register, posters, SDS register
Specialist tools	RL Register, Electrical Tests, Public Toilet Finder
Workforce	Timesheets, Attendance, Team, Schedule, Profiles
Administration	Settings, Billing, Help, Lists, Library, App Documents, User Logs, Sign-in History
Platform owner	Owner Console and Dazza AI

Document basis

Prepared from the release repository's product registries, protected route map, security and timesheet services, PDF/export handlers, Capacitor dependencies and release-preparation record. It is a product and platform overview, not legal, accounting, safety, engineering or insurance advice.
